## DESCRIPTION

SUBSTITUTED AROMATIC AMIDE DERIVATIVE, INTERMEDIATE  
THEREOF, AGROHORTICULTURAL INSECTICIDE CONTAINING  
THEREOF AND METHOD FOR THE USE THEREOF

## TECHNICAL FIELD

The present invention relates to a  
substituted aromatic amide derivative, an intermediate  
thereof, an agrohorticultural insecticide containing  
5 said substituted aromatic amide derivative as an active  
ingredient, and a method for the use thereof.

## BACKGROUND ART

Although JP-A-11-240857, JP-A-2001-131141,  
JP-A-2001-64258 and JP-A-2001-64268 disclose compounds  
10 which are considered analogous to the compound of the  
present invention, these patent gazettes neither  
disclose nor suggest the compounds which are  
represented by the general formula (I) of the present  
invention.

15 In the field of crop production such as  
agriculture, horticulture, etc., great injuries are  
done by pest insects even today, and development of a  
novel agrohorticultural insecticide is earnestly  
awaited, especially considering the appearance of  
20 resistant pest insecticides to the existing  
insecticides. At the same time, the age of  
agricultural workers becomes higher year by year, which

makes it necessary to think out various labor-economizing methods of pesticide application and to create an agrohorticultural insecticide suitable for such new application methods.

## 5 DISCLOSURE OF THE INVENTION

The present inventors have conducted extensive studies with the aim of developing a novel agrohorticultural insecticide. As a result, it has been found that the fluoroalkyl-substituted aromatic  
10 amine derivatives represented by general formula (IV), which are new compounds not found in literature, are useful as an intermediate for the manufacture of various physiologically active derivatives such as medical drugs, pesticides, etc. Further, it has also  
15 been found that the substituted aromatic amide derivatives represented by general formula (I) derived from the above-mentioned compounds are new compounds not found in literature; and they exhibit an excellent insecticidal effect at a low dosage as compared with  
20 prior compounds found in literature, and exhibit high uptake and translocation from the root and an excellent insecticidal effect especially when applied to soil. Based on these findings, this invention has been accomplished.

25 Thus, the present invention relates to a substituted aromatic amide derivative represented by the following general formula (I):

Next, typical examples of the present invention are presented below. The present invention is by no means limited by these examples.

Example 1. Production of N<sup>2</sup>-(1,1-dimethyl-2-methylthioethyl)-3-iodo-N<sup>1</sup>-(2-methyl-4-[2,2,2-trifluoro-1-(trifluoromethyl)ethyl]phenyl}phthalamide (Compound No. 5-28)

(1-1) To 30 ml of tetrahydrofuran (THF) was added 0.5 g (13.2 mmol) of lithium aluminum hydride. While keeping the resulting suspension at a temperature of 0°C, a solution of 13.8 g (20 mmol) of 2-methyl-4-[1,2,2,2-tetrafluoro-1-(trifluoromethyl)ethyl]aniline

in 20 ml of THF was dropped into the suspension with stirring over a period of 15 minutes. After completion of the dropping, the resulting mixture was stirred at room temperature for 30 minutes, and then heated under  
5 reflux for one hour to make progress a reaction. The reaction mixture was poured into ice water, 20 ml of 1N-aqueous solution of sodium hydroxide was added, and the resulting mixture was stirred. The mixture was extracted with 50 ml of methyl tert-butyl ether, the  
10 organic layer was dried on anhydrous magnesium sulfate and concentrated under reduced pressure, and the residue was purified by distillation under reduced pressure. Thus, 11.4 g (yield: 89%) of 2-methyl-4-[2,2,2-trifluoro-1-(trifluoromethyl)ethyl]aniline  
15 (Compound No. 1-3) was obtained as a fraction having a boiling point of 103°C (6 mmHg).

(1-2) In 10 ml of acetonitrile was dissolved 750 mg (2.0 mmol) of N-(1,1-dimethyl-2-methylthioethyl)-6-iodophthalic acid isoimide, to which were added 515 mg  
20 (2.0 mmol) of 2-methyl-4-[2,2,2-trifluoro-1-(trifluoromethyl)ethyl]aniline and 10 mg of trifluoroacetic acid. The mixture was stirred at room temperature for 2 hours. The deposited crystal was collected by filtration and washed with a small  
25 quantity of ether. Thus, 1.0 g of the objective compound was obtained (yield: 79%).

Example 2. Production of N<sup>2</sup>-(1,1-dimethyl-2-methylsulfinylethyl)-3-iodo-N<sup>1</sup>-[2-methyl-4-{2,2,2-

trifluoro-1-(trifluoromethyl)ethyl}phenyl}phthalamide  
(Compound No. 5-29)

In 10 ml of chloroform was dissolved 0.63 g  
(1.0 mmol) of N<sup>2</sup>-(1,1-dimethyl-2-methylthioethyl)-3-  
5 iodo-N<sup>1</sup>-{2-methyl-4-[2,2,2-trifluoro-1-  
(trifluoromethyl)ethyl}phenyl}phthalamide, and the  
resulting solution was cooled to 0°C. To the solution  
was added 0.19 g (1.1 mmol) of meta-chloroperbenzoic  
acid. After stirring for one hour, the reaction  
10 mixture was washed with 10% aqueous solution of  
potassium carbonate and dried on anhydrous magnesium  
sulfate, and the solvent was dissolved off under  
reduced pressure. Thus, 0.45 g of the objective  
compound was obtained (yield: 69%).

15 Example 3. Production of N<sup>2</sup>-(1,1-dimethyl-2-  
methylthioethyl)-3-iodo-N<sup>1</sup>-{2-chloro-6-[2,2,2-trifluoro-  
1-(trifluoromethyl)ethyl}pyridin-3-yl}phthalamide  
(Compound No. 8-4)

(3-1) In 80 ml of DMSO was suspended 2.84 g (75.0  
20 mmol) of sodium borohydride, to which was added 3.93 g  
(15 mmol) of 5-amino-2-[1,2,2,2-tetrafluoro-1-  
(trifluoromethyl)ethyl}pyridine with stirring. The  
mixture thus obtained was stirred at room temperature  
for 50 hours. The reaction mixture was slowly poured  
25 into ice water to decompose the excessive sodium  
borohydride. After extraction with 50 ml of ethyl  
acetate, the organic layer was washed three times with  
water and then once with saturated aqueous solution of

sodium chloride, dried over anhydrous magnesium sulfate, and then concentrated under reduced pressure. The residue was separated and purified by silica gel column chromatography (hexane/ethyl acetate = 4:1).

5 Thus, 1.0 g of 5-amino-2-[2,2,2-trifluoro-1-(trifluoromethyl)ethyl]pyridine (Compound No. 3-1) was obtained (yield: 27%).

(3-2) In 10 ml of acetonitrile was dissolved 0.56 g (2.3 mmol) of 5-amino-2-[2,2,2-trifluoro-1-(trifluoromethyl)ethyl]pyridine, to which was added  
10 0.31 g (2.3 mmol) of N-chlorosuccinimide (NCS). The mixture thus obtained was heated under reflux for one hour to make progress a reaction. The solvent was distilled off under reduced pressure, and the residue  
15 was separated and purified by silica gel column chromatography (hexane/ethyl acetate = 2:1) to obtain 0.55 g of 3-amino-2-chloro-6-[2,2,2-trifluoro-1-(trifluoromethyl)ethyl]pyridine (Compound No. 4-2) (yield: 86%).

20 (3-3) In 10 ml of acetonitrile was dissolved 750 mg (2.0 mmol) of N-(1,1-dimethyl-2-methylthioethyl)-6-iodophthalic acid isoimide. To the solution were added 0.55 g (2.0 mmol) of 3-amino-2-chloro-6-[2,2,2-trifluoro-1-(trifluoromethyl)ethyl]pyridine and 10 mg  
25 of trifluoroacetic acid. The mixture thus obtained was stirred at room temperature for 10 hours. The reaction mixture was poured into ice water, and the phase of reaction mixture was washed with saturated aqueous

solution of sodium bicarbonate and dried on anhydrous magnesium sulfate. The solvent was distilled off under reduced pressure, and the residue was separated and purified by silica gel column chromatography

5 (hexane/ethyl acetate = 4:1) to obtain 0.83 g of the objective compound (yield 63%).

Example 4. Production of 3-iodo-2-(4,4-dimethyloxazolin-2-yl)-2'-methyl-4'-[2,2,2-trifluoro-1-(trifluoromethyl)ethyl]benzanilide (Compound No. 10-1)

10 In pyridine was dissolved 1.1 g (1.8 mmol) of 3-iodo-N<sup>1</sup>-(2-methyl-4-[2,2,2-trifluoro-1-(trifluoromethyl)ethyl]phenyl)-N<sup>2</sup>-(2-hydroxy-1,1-dimethylethyl)phthalamide. To the solution was added 0.25 g (2.2 mmol) of methanesulfonyl chloride. The  
15 mixture thus obtained was stirred at room temperature for 8 hours and then concentrated under reduced pressure. The residue was diluted with ethyl acetate and washed with water, the organic layer was dried on anhydrous magnesium sulfate, the solvent was distilled  
20 off under reduced pressure, and the residue was separated and purified by silica gel column chromatography (hexane/ethyl acetate = 2:1). Thus, 0.64 g of the objective compound was obtained (yield 60%).

The agrohorticultural insecticide, containing  
20 the substituted aromatic amide derivative represented by formula (I) or salt thereof of the present invention, has a marked controlling effect on the above-exemplified insect pests, sanitary pests and/or nematodes, which are injurious to paddy field crops,  
25 upland crops, fruit trees, vegetables and other crops, flowers and ornament plants, and the like. Therefore, the desired effect of the agrohorticultural insecticide of the present invention can be exhibited by applying

the insecticide to the nursery facility, paddy field water, stalks and leaves or soil of paddy field, upland field, fruit trees, vegetables, other crops or flowers and ornament plants at a season at which the insect  
5 pests, sanitary pests or nematodes are expected to appear, before their appearance or at the time when their appearance is confirmed. Particularly, a preferable application for using the agrohorticultural insecticide of the present invention is the application  
10 for which both of "penetration and translocation" are utilized, wherein the present agrohorticultural insecticide is applied to the nursery soil of crops, ornamental plants or the like; the picking-in hole soil at a transplantation; the plant roots; the irrigation  
15 water; or the cultural water of a water culture; so as to uptake the substituted aromatic amide derivatives of the present invention from the roots through or not through the soil.

In general, the agrohorticultural insecticide  
20 of the present invention is used after being prepared into conveniently usable forms according to ordinary manner for preparation of agrochemicals.

That is, the substituted aromatic amide derivative of formula (I) or salt thereof and an  
25 appropriate carrier are blended optionally together with an adjuvant in a proper proportion and prepared into a suitable preparation form such as suspension, emulsifiable concentrate, soluble concentrate, wettable

powder, granules, dust or tablets through dissolution, separation, suspension, mixing, impregnation, adsorption or sticking.

The inert carrier used in the present invention may be either solid or liquid. As the solid carrier, soybean flour, cereal flour, wood flour, bark flour, saw dust, powdered tobacco stalks, powdered walnut shells, bran, powdered cellulose, extraction residues of vegetables, powdered synthetic polymers or resins, clay (e.g. kaolin, bentonite and acid clay), talc (e.g. talc and pyrophyllite), silica materials (e.g. diatomaceous earth, siliceous sand, mica, white carbon, i.e. synthetic high-dispersion silicic acid, also called finely divided hydrated silica or hydrated silicic acid, some of the commercially available products contain calcium silicate as the major component), activated carbon, powdered sulfur, pumice, calcined diatomaceous earth, ground brick, fly ash, sand, calcium carbonate, calcium phosphate and other inorganic or mineral powders, chemical fertilizers such as ammonium sulfate, ammonium phosphate, ammonium nitrate, urea, ammonium chloride and the like, and compost. These carriers may be used either alone or as a mixture of two or more carriers.

The liquid carrier is that which itself has a solubility or which is without such solubility but is capable of dispersing an active ingredient with the aid of an adjuvant. The following are typical examples of

the liquid carrier and can be used alone or as a mixture thereof. Water; alcohols such as methanol, ethanol, isopropanol, butanol and ethylene glycol; ketones such as acetone, methyl ethyl ketone, methyl isobutyl ketone, diisobutyl ketone and cyclohexanone; 5 ethers such as ethyl ether, dioxane, cellosolve, dipropyl ether and tetrahydrofuran; aliphatic hydrocarbons such as kerosene and mineral oil; aromatic hydrocarbons such as benzene, toluene, xylene, solvent naphtha and alkylnaphthalene; halogenated hydrocarbons 10 such as dichlorethane, chloroform, carbon tetrachloride and chlorobenzene; esters such as ethyl acetate, diisopropyl phthalate, dibutyl phthalate and dioctyl phthalate; amides such as dimethylformamide, diethylformamide and dimethylacetamide; nitriles such 15 as acetonitrile; and dimethyl sulfoxide.

The following are typical examples of the adjuvant, which are used depending upon purposes and used alone or in combination of two or more adjuvants 20 in some cases, or need not to be used at all.

To emulsify, disperse, dissolve and/or wet an active ingredient, a surfactant is used. As the surfactant, there can be exemplified polyoxyethylene alkyl ethers, polyoxyethylene alkylaryl ethers, 25 polyoxyethylene higher fatty acid esters, polyoxyethylene resinates, polyoxyethylene sorbitan monolaurate, polyoxyethylene sorbitan monooleate, alkylarylsulfonates, naphthalene-sulfonic acid

condensation products, ligninsulfonates and higher alcohol sulfate esters.

Further, to stabilize the dispersion of an active ingredient, tackify it and/or bind it, there may  
5 be used adjuvants such as casein, gelatin, starch, methyl cellulose, carboxymethyl cellulose, gum arabic, polyvinyl alcohols, turpentine, bran oil, bentonite and ligninsulfonates.

To improve the flowability of a solid  
10 product, there may be used adjuvants such as waxes, stearates and alkyl phosphates.

Adjuvants such as naphthalenesulfonic acid condensation products and polycondensates of phosphates may be used as a peptizer for dispersible products.

15 Adjuvants such as silicone oil may also be used as a defoaming agent.

The content of the active ingredient may be varied according to the need, thus, it can be properly selected from the range between 0.01 and 90% by weight  
20 in terms of 100% by weight of the agrohorticultural insecticide of the present invention. For example, in dusts or granules, the suitable content thereof is from 0.01 to 50% by weight. In emulsifiable concentrate and flowable wettable powder, too, the suitable content is  
25 from 0.01 to 50% by weight.

The agrohorticultural insecticide of the present invention is used to control a variety of insect pests in the following manner. That is, it is

applied to a crop on which the insect pests are expected to appear or a site where appearance of the insect pests is undesirable, as it is or after being properly diluted with or suspended in water or the like, in an amount effective for control of the insect pests.

The applying dosage of the agrohorticultural insecticide of the present invention is varied depending upon various factors such as a purpose, insect pests to be controlled, a growth state of a plant, tendency of insect pests appearance, weather, environmental conditions, a preparation form, an application method, an application site and an application time. It may be properly chosen in a range of 0.001 g to 10 kg, preferably 0.01 g to 1 kg (in terms of active ingredient compound) per 10 ares depending upon purposes.

The agrohorticultural insecticide of the present invention may be used in admixture with other agrohorticultural insecticides, acaricides, nematocides, fungicides or biological pesticides, in order to expand both spectrum of controllable diseases and insect pest species and the period of time when effective applications are possible or to reduce the dosage. Of course, the agrohorticultural insecticide of the present invention may be used in admixture with herbicides, plant growth regulators, fertilizer and the like, depending on the scene where the present

agrohorticultural insecticide of the present invention is applied to.

Test Example 4: Controlling effect on diamond back moth (Plutella xylostella) with soil treatment of olive

The pricking-in hole treatment was done with the granules containing each compound listed in Tables 4 according to the formulation examples of the present invention, at the fix planting of olive (cultivar; YR Seitoku). Nine days after the fix planting, about 50 eggs of diamond back moth (Plutella xylostella) were inoculated, then the number of the parasitic insects of diamond back moth (Plutella xylostella) was counted on the specified days after the inoculation.

The result is shown in Table 13 below.

Table 13

No.	Dosage		Number of the parasitic insects/three plants		
	mgAI/plant		After 18 days	After 25 days	After 32 days
5-28	10		0	5	14
5-29	10		0	0	0
5-30	10		0	3	22
A	10		10	60	-
B	10		40	43	-
C	10		56	80	-
Untreated area	-		47	64	82

The active ingredient of the comparative compounds were as follows:

- A: Compound No. 372 disclosed in JP-A-11-240857,  
 B: Compound No. 122 disclosed in JP-A-2001-131141 and  
 5 C: Compound No. 124 disclosed in JP-A-2001-131141.

As is clearly indicated in Table 13, in case of treating the soil with the present compound, it exhibited the excellent controlling effect even after 32 days.

- 10 On the other hand, many parasite insects were observed after 18 days in the olive treated with the comparative compounds disclosed in JP-A-11-240857 and JP-A-2001-131141, and the controlling effects of the comparative compounds were clearly inferior to that of  
 15 the present compound already after 25 days.
